

DEPTH TO WATER TABLE

20 0 20 40 60 Miles

1:2750000

The depth-to-water table is the distance from the landsurface to the water table. The source for this data is a 1:250,000-scale map compiled by the USGS using computerized well log information and depth to water contours from other published sources such as county reports and county solid waste plans. Scarcity of data sources, variable topography and water fluctuations make this a layer of varying reliability.

This data layer is included in DVGMLib, a part of the DNRView extension to ArcView. DNRView makes it easy to view various DNR geographic data. To learn more about DNRView users can obtain DNRView from the appropriate regional contact listed in the "GIS DataSharing" section.
